AI-Workforce Enablement and Readiness Assessment

People/Execution Leader Individual Feedback Report

FULL ASSESSMENT

Participant: Susan Sample

Role: Senior Program Manager, AI Transformation Program

Date: Sample Report

Report Type: People/Execution Leader Self-Assessment
(Full Individual Assessment) + AI Fluency Knowledge Check

1 Introduction

This report is the People Leader / Execution Manager version of the AI-Workforce Enablement and Readiness Assessment. It measures how you translate AI strategy, coach people, run execution, create team conditions, and stay personally ready — it is not the senior-leader vision and enterprise-transformation assessment.

This instrument is for people managers, team leads, and supervisors — and equally for project, program, and operations managers who run AI-enabled work without formal direct reports. If you coordinate, coach, or drive AI-enabled work across a team or a cross-functional program, this is your version, whether or not anyone reports to you on an org chart.

This is the complete, full-length assessment: 86 items across five scored modules, an unscored narrative section in your own words, and a 25-question AI Fluency Knowledge Check. Every parameter is measured directly — there is no sampling and no “not measured” caveat anywhere in this report, unlike the shorter Executive Lite tier.

The five modules measure 17 named parameters in total: 7 AI People Leadership & Execution competencies, Ability for Change, the four Holt readiness beliefs behind Change Readiness, 10 Organizational & Team Enablers items (5 inherited from the organization as D1, 5 created by your own team as D2), and 3 Psychological & Motivational Readiness competencies. Fluency is scored and reported separately and is not folded into your Overall Readiness figure.

2 About This Assessment

People Leaders and Execution Managers succeed when they translate enterprise AI strategy into clear team priorities, coach people to work confidently with AI, model productive personal use themselves, run AI-enabled execution with real rigor, create psychological safety for the team to experiment, build local champions and peer networks, and own the outcomes and responsible use of what the team ships.

A 1–5 agreement/effectiveness scale is used throughout Modules A–E because this is a development instrument, not a selection test — the goal is to see how much a behavior or belief is present, not to sort people into pass/fail categories.

The AI Fluency Knowledge Check exists so a high self-rating is never accepted at face value when demonstrated knowledge of core AI concepts is low. It is graded objectively against a fixed answer key — there is no self-rating involved in this section at all.

3 How to Read This Report

Scores run from 1 (strongly disagree / almost never) to 5 (strongly agree / almost always). There is no universally “good” or “bad” score — the most useful reading compares modules and parameters against each other within this report, since that contrast is where real, actionable patterns show up.

Module scores are averages: each module's named parameters are scored first, then averaged into the module figure shown in the Executive Snapshot. Overall Self-Rated Readiness is the average of the five module scores (Modules A–E only) — your unscored “In Your Own Words” responses and your Fluency score are both reported separately and are never folded into that average.

Every finding in the Executive Snapshot, Overall Readiness Profile, and Priority Development Themes sections is drawn from your raw scores using AII SV's pattern-based methodology — the same consistent approach applied across every AII SV report — rather than written by hand for this report specifically.

4 Executive Snapshot

Figure 1. Executive Snapshot — Module Scores

Module	Score	Coverage
AI People Leadership & Execution	 3.69	35 of 35 items measured
Ability for Change	 4.67	6 of 6 items measured
Change Readiness	 3.9	20 of 20 items measured
Organizational & Team Enablers	 3.2	10 of 10 items measured
Psychological & Motivational Readiness	 4.4	15 of 15 items measured
Overall Self-Rated Readiness	 3.97	Average of Modules A–E only

At a glance: Highest-scoring module: Ability for Change (4.67). Lowest-scoring module: Organizational & Team Enablers (3.2). Spread: 1.47 points.

What Jumps Out

Four of five modules score at 3.69 or higher, and Fluency comes in strong at 84% — but Module D (Organizational & Team Enablers) is the one outlier at 3.2, and it splits into two meaningfully different sub-scores explored separately in Section 7: D1 (inherited from the organization) and D2 (created on your own team).

Ability for Change (4.67) is this profile's standout strength, with nothing in that module scoring below a 4 — Module A tells a more mixed story, pairing genuine personal-productivity strength with its two lowest items. See Module A's detail in Section 7 for what those two items have in common.

Your own comments in Section 5 about operating with influence rather than formal authority connect directly to that Module A pattern and to Module D1's organizational conditions; the Congruency Check following Section 6 walks through exactly how.

5

In Your Own Words

These responses are unscored and are not part of your Overall Readiness figure. They exist to explain the scores above in your own words — shown here exactly as submitted.

What are the biggest AI challenges you face in your role right now?

"Getting traction on AI practices across a program where I have influence but no formal authority over most of the people doing the work."

What are your top 3 AI-related priorities for the next 90 days?

1. Document and share the three prompting and workflow patterns that saved the most time this quarter. 2. Get a lightweight, recurring forum going so contributors across the program can see what's actually working. 3. Find one senior sponsor willing to publicly back the program's AI practices.

Which AI tools, platforms, or infrastructure do you personally use today?

"I use AI tools daily and build most of my own analysis and documentation workflows around them — this is the part I'm most confident in."

Which of those does the organization actually have access to and use?

"Inconsistent. Some contributors use AI heavily, others not at all, and there's no shared view across the program of what's working."

What would most help you make progress in the next 90 days?

"A way to turn what I've learned personally into something the broader program can actually pick up, given I don't manage most of these people directly."

6

Overall Readiness Profile

Figure 2. Overall Readiness Profile — Module Averages

WHAT THIS PATTERN SUGGESTS

Fluency (84%) and personal execution are standout strengths — but the two parameters that depend on having others to lead, Coaches People to Work with AI (2.2) and Builds Local Champions and Peer Networks (2.4), are this report's clear low points. This reads as a structural multiplier-effect gap, not a competence gap: the same skill and knowledge that make you personally effective have not yet had a formal channel to multiply through others — common, and expected, for a program/execution role without direct reports.

This finding was identified directly from your raw module averages and 17 named-parameter scores using AllSV's pattern-based methodology — it is not a subjective read of your results. Your data was checked against every named pattern in the current library; this was the one pattern that met its criteria.

A Note on This Analysis

What a Self-Assessment cannot do on its own, however complete, is confirm whether the people you coordinate with across this program read your influence and coaching the same way you do — it reflects one vantage point, even a fully measured one. Treat the pattern above as a well-measured, credible signal from your own perspective, not yet a cross-checked team diagnosis.

Congruency Check: Scores vs. Your Own Words

Where your open-ended comments (Section 5) line up with your scores, that agreement strengthens confidence in the finding. Where they seem to pull in different directions, that gap is not a scoring error — it is itself worth a second look.

1

Aligned — Personal Productivity vs. Coaching Reach: Your comment that you “build most of my own analysis and documentation workflows around” AI tools directly matches the data — Models AI-Enabled Personal Productivity is your highest Module A item (4.8), while Coaches People to Work with AI is your lowest (2.2). The qualitative and quantitative pictures agree: this is a personal-use strength that has not yet become a coaching practice, not an inconsistency in the scoring.

2

Worth reflecting on — Influence Without Authority: Your comment about “influence but no formal authority over most of the people doing the work” lines up with both the Module A coaching/champions gap and the lower D1 score (2.8, conditions inherited from the organization). Worth reflecting on whether closing this gap is mainly about your own coaching habits, or about getting a structural asset — a sponsor, a forum, a mandate — that a program role without direct reports does not automatically come with.

3

Worth reflecting on — Management Support vs. Seeking a Sponsor: Management Support (3.0) is a middling score, and your stated priority to “find one senior sponsor willing to publicly back the program's AI practices” suggests you already see this as unresolved. Worth sitting with whether a single sponsor would move this number, or whether the gap is broader than one relationship.

Questions worth sitting with, rather than answering immediately:

- Is the coaching-and-champions gap something you could close through informal influence and your existing relationships, or does it genuinely require a mandate or formal authority you don't currently have?
- If you found one senior sponsor for this program, which specific D1 condition — vision clarity, resourcing, top-team alignment, use-case sharing, or policy clarity — would you ask them to fix first?
- What would it look like to treat ‘building champions’ as its own 90-day priority, the same deliberate way you've treated your own tool adoption?

Going Deeper

A more reliable picture of whether this pattern holds beyond your own vantage point comes from adding other perspectives to this same instrument. AIIISV offers ways to build that fuller picture and turn it into action:

- A 360 Assessment for this same role, gathering Manager, Peer, Direct Report (where applicable), and Stakeholder views alongside your own Self-Assessment, to see whether program contributors experience your coaching and influence the way you do
- Organization-wide rollouts of this same Individual Assessment across other People Leaders and Execution Managers, to see whether the coaching-and-champions gap is personal to this program or a broader pattern among IC-style leads
- Facilitated sessions that bring these findings into a live conversation with the senior sponsor this report's priorities already point toward
- Customized coaching or training targeted specifically at building a champion network without relying on formal reporting authority

7 Module Detail

Module A — AI People Leadership & Execution

The manager behaviors required to turn AI strategy into team results, across 7 competencies, all measured directly (35 items).

Why this framework: These competencies come from the *People Leaders & Execution Managers Handbook*, a separate instrument from the *Senior Leader* version — it does not share Module A, because translating strategy into team-level execution and coaching is a genuinely different job from setting enterprise AI direction. Research on both digital and AI transformation consistently shows that adoption succeeds or stalls at the manager layer, not just at the top — which is why this module measures manager behavior directly rather than assuming it follows from senior intent.

Figure 3. AI People Leadership & Execution — Item Scores

Data Analysis: Models AI-Enabled Personal Productivity (4.8) and Runs AI-Enabled Execution (4.4) are clear strengths — hands-on AI use and disciplined delivery are not in question here. Coaches People to Work with AI (2.2) and Builds Local Champions and Peer Networks (2.4) are the module's two low points, well below the rest. Both of these specifically require influencing people outside a direct reporting line — consistent with a program role that runs on influence rather than formal authority.

Definitions

- **Translates AI Strategy into Team Priorities:** Converts AI intent into team goals, trade-offs, and near-term work.
- **Coaches People to Work with AI:** Develops others' skill, judgment, and confidence.
- **Models AI-Enabled Personal Productivity:** Uses AI in real work and makes that use teachable.

- **Runs AI-Enabled Execution:** Specs, owners, review, measurement, and stopping low-value work.
- **Creates Team Psychological Safety for AI Experimentation:** Makes it safe to try, fail, question, and share.
- **Builds Local Champions and Peer Networks:** Spreads adoption through people on and beyond the team.
- **Owns Outcomes and Responsible Use:** Accountability for results, quality, privacy, and appropriate use.

Module B — Ability for Change

Personal capacity to adapt, learn, and remain effective during AI-driven change. A single flat scale, all 6 items measured directly.

Figure 4. Ability for Change — Item Scores

Data Analysis: This is your highest-scoring module overall (average 4.67). Four of six items scored 5, and nothing in this module is below a 4 — Ability for Change is a genuine, consistent strength across this profile.

Definitions

- **Ability for Change:** Personal capacity to adapt, learn, and remain effective during AI-driven change.

Module C — Change Readiness (Team Level)

Holt et al.'s four readiness beliefs, applied at the team level: is AI the right priority for this team, will your manager and the system unblock the work, can this team become effective with AI, and will this team and you benefit. All 4 dimensions measured directly (20 items).

Why this framework: This module uses Holt, Armenakis, Feild, and Harris's Readiness for Organizational Change framework, with the referent shifted from the enterprise to this team — readiness is fundamentally a set of beliefs, not a fixed personality trait, and any one of the four beliefs below can stall adoption on its own, even when the tools and the team's own skills are otherwise good. That is why all four are measured directly rather than assumed from the other modules.

Figure 5. Change Readiness — Item Scores

Data Analysis: A solid module overall (average 3.9). Appropriateness (4.2) and Personal Valence (4.4) are strong — you believe in this work and see real benefit in it. Management Support (3.0) is comparatively the softest of the four, consistent with your own stated priority of finding a senior sponsor.

Definitions

- **Appropriateness:** Belief that AI is the right priority for this team's work right now.
- **Management Support:** Belief that your manager and the wider system will actually unblock this team's AI work.
- **Change Efficacy:** Belief that this team has, or can build, the ability to become effective with the AI tools that matter.
- **Personal Valence:** Belief that this team, and you personally, will benefit.

Module D1 — Organizational & Team Enablers (Inherited from the Organization)

Conditions this team inherits from the wider organization rather than creates itself — direction, resourcing, alignment, shared practice, and policy clarity. A single flat scale, all 5 items measured directly.

Figure 6. Enablers — Inherited — Item Scores

Data Analysis: The lower of the two Enablers sub-scores (average 2.8). Adequate time/budget/talent (2) and top-team alignment visibility (2) are the weakest individual items — conditions set by the wider organization, not by you, and a reasonable target for the sponsor conversation you've already identified as a priority.

Definitions

- **Enablers — Inherited from the Organization:** Conditions this team inherits from the wider organization: AI direction clarity, resourcing, visible senior alignment, usable practice-sharing from other teams, and clear data/tool/acceptable-use policy.

Module D2 — Organizational & Team Enablers (Created on the Team)

Conditions this manager and team create for themselves, regardless of what the wider organization provides — psychological safety, local champions, internal sharing, protected learning time, and followed standards. A single flat scale, all 5 items measured directly.

Figure 7. Enablers — Created on the Team — Item Scores

Data Analysis: The higher of the two Enablers sub-scores (average 3.6, versus D1's 2.8) — the conditions you can create yourself on this program (psychological safety, sharing what works, protected learning time, followed standards) are in noticeably better shape than the conditions you inherit. This is worth naming directly: where you have real control, results already look different.

Definitions

- **Enablers — Created on the Team:** Conditions this manager and team create for themselves: psychological safety to experiment, an active local champion, systematic sharing of what works, protected learning time, and AI-use standards that are actually followed.

Module E — Psychological & Motivational Readiness

Internal mindset and motivational factors that influence engagement with AI, across 3 competencies, all measured directly (15 items).

Why this framework: These items sit conceptually alongside Big Five personality-trait research — particularly Openness and Emotional Stability, both linked in the literature to tolerance for ambiguity and organizational change. This module measures your current attitudes and behaviors, not a validated personality inventory, so treat it as a snapshot of where you are now rather than a fixed trait profile.

Figure 8. Psychological & Motivational Readiness — Item Scores

Data Analysis: A strength across all three competencies (average 4.4), with Learning Orientation (4.6) as the high point. Nothing in this module points to a gap — psychological and motivational readiness is not where this profile's real work is.

Definitions

- **Learning Orientation:** Seeking out new ways of working with AI rather than waiting to be trained.
- **Response to Ambiguity & Pressure:** Staying constructive and effective when AI outputs or requirements are imperfect or changing.
- **AI-Related Drivers & Values:** Underlying beliefs about whether AI primarily creates opportunity or threat.

AI Fluency Knowledge Check

Overall Fluency Score: 21 of 25 correct (84%)

General + Technical/AI-SDLC questions combined, Form C. 80–89% maps to a Fluency score of 4 on the assessment's 1–5 scale.

Full question-by-question detail is in Appendix A.

Calibration note: Demonstrated Fluency (84%) is objectively strong and consistent with this report's other personal-capability strengths (Module A's execution and productivity items, Module B, Module E). It rules out a knowledge gap as the explanation for the coaching-and-champions finding above — the constraint there is structural and relational, not a gap in your own grasp of the underlying concepts.

9 Suggested Next Steps

- 1 **Treat coaching and champion-building as a deliberate 90-day goal**, not an automatic side effect of your own strong personal AI use — the data shows these do not move together on their own.
- 2 **Pursue the senior sponsor you've already identified as a priority**, and use it specifically to address the two weakest D1 items — resourcing and visible top-team alignment — rather than a general ask for support.
- 3 **Add a 360 Assessment** to see whether the program's contributors experience your coaching and influence the way you rate it yourself, especially given you lead largely without formal authority.

10 Priority Development Themes

- 1 **The coaching-and-champions gap is the headline finding:** Fluency and personal execution are standout strengths, but the two parameters that depend on leading others — Coaching and Building Champions — are this report's clear low points. This is where the next phase of growth sits.
- 2 **This is a structural gap, not a competence gap:** A program role without formal direct reports naturally has fewer built-in channels for coaching and champion-building than a role with a team org chart. That context matters for how this finding should be acted on.
- 3 **Where you control the conditions, they are already strong:** D2 (conditions you create yourself) is a full point higher than D1 (conditions inherited from the organization) — the gap to close is mostly upstream of you, not in your own practice.

Action Planning

Reflecting on the results above, write down your top 5 actions to take next.

Appendix A — AI Fluency Knowledge Check Detail

(Form C — Questions, Your Answer, Correct Answer, and Result)

Question	Your Answer	Correct Answer	Result
What does SDD stand for in this assessment's engineering context?	Specification-Driven Development	Specification-Driven Development	Correct
What does ASI stand for?	Adaptive System Interface	Artificial Superintelligence	Incorrect
AutoML refers to:	Techniques that automate model selection, tuning, and feature engineering	Techniques that automate model selection, tuning, and feature engineering	Correct
What does XAI stand for?	Explainable AI	Explainable AI	Correct
ADAM (in deep learning) is:	A hardware accelerator standard	An optimization algorithm that adapts learning rates for each parameter	Incorrect
Multimodal AI can:	Handle more than one kind of input, such as text, image, and audio	Handle more than one kind of input, such as text, image, and audio	Correct
Overfitting occurs when a model:	Fits training examples so tightly that it generalizes poorly	Fits training examples so tightly that it generalizes poorly	Correct
Human-on-the-loop differs from human-in-the-loop because the person:	Supervises and can intervene, but does not approve every step	Supervises and can intervene, but does not approve every step	Correct
Synthetic data is:	Data generated by a system rather than collected from real events	Data generated by a system rather than collected from real events	Correct
Model risk includes:	Harm from errors, bias, privacy leakage, misuse, or over-reliance	Harm from errors, bias, privacy leakage, misuse, or over-reliance	Correct
What does LLM stand for?	Large Language Model	Large Language Model	Correct
An AI agent is best described as:	A system that can plan, use tools, and take actions	A system that can plan, use tools, and take actions	Correct
Vibe coding refers to:	Building software primarily via natural-language prompts with AI	Building software primarily via natural-language prompts with AI	Correct
Prompt engineering is:	Designing inputs and instructions that improve model performance	Designing inputs and instructions that improve model performance	Correct
Responsible AI emphasizes:	Safety, fairness, privacy, accountability, and human oversight	Safety, fairness, privacy, accountability, and human oversight	Correct

Question	Your Answer	Correct Answer	Result
In MCP, Prompts are:	A logging format for model outputs	Pre-written reusable templates that guide model behavior	Incorrect
An AI agentic workspace (IDE) is designed to:	Manage multi-file edits, spec-driven work, and broader codebase tasks	Manage multi-file edits, spec-driven work, and broader codebase tasks	Correct
An AI test / spec evaluator typically:	Designs and writes tests from code or specification changes	Designs and writes tests from code or specification changes	Correct
A framework is:	A reusable, semi-complete structure that developers extend or override	A reusable, semi-complete structure that developers extend or override	Correct
A library is:	A collection of reusable code called to perform isolated tasks	A collection of reusable code called to perform isolated tasks	Correct
Middleware typically intercepts requests to:	Compress files before sending them to storage	Enforce security, logging, and validation	Incorrect
Endpoint definitions expose:	Structured system paths via HTTP verbs or similar interfaces	Structured system paths via HTTP verbs or similar interfaces	Correct
Client SDKs are used to:	Simplify connections to external platforms through packaged methods	Simplify connections to external platforms through packaged methods	Correct
Design patterns are:	Repeatable solutions to common design problems	Repeatable solutions to common design problems	Correct
Eval / evaluation harnesses in agentic work are used to:	Measure whether outputs meet spec or quality bars	Measure whether outputs meet spec or quality bars	Correct

Overall Fluency: 21 / 25 correct = 84%

Appendix B — Item-Level Data

Every named parameter score, computed as the average of its underlying items — nothing rounded until display.

Module	Parameter	Score (of 5)
A	Translates AI Strategy into Team Priorities	4.2
A	Coaches People to Work with AI	2.2
A	Models AI-Enabled Personal Productivity	4.8
A	Runs AI-Enabled Execution	4.4
A	Creates Team Psychological Safety for AI Experimentation	3.8
A	Builds Local Champions and Peer Networks	2.4
A	Owns Outcomes and Responsible Use	4
B	Ability for Change (avg. of 6 items)	4.6667
C	Appropriateness	4.2
C	Management Support	3
C	Change Efficacy	4
C	Personal Valence	4.4
D1	Enablers — Inherited from the Organization (avg. of 5 items)	2.8
D2	Enablers — Created on the Team (avg. of 5 items)	3.6
E	Learning Orientation	4.6
E	Response to Ambiguity & Pressure	4.2
E	AI-Related Drivers & Values	4.4

Appendix C — Respondent & Submission Details

Field	Value
Access Code	PLS-SAMPLE-01
Respondent Email	susan.sample@example.com
Product Line	People/Execution Leader
Job Title	Senior Program Manager, AI Transformation Program
Fluency Form	C
Overall Self-Rated Readiness (avg. of Modules A-E)	3.97

Appendix D — Holt Change Readiness Development Actions

From the *People Leaders & Execution Managers Handbook's Holt Development Actions table* — the recommended first actions for a manager when a given Change Readiness belief is low. None of your four beliefs are low by that standard; the full table is included below for reference alongside your Module C scores.

If low	Typical belief	First actions
Appropriateness (yours: 4.2)	"Wrong change, wrong time."	Publish the data. Contrast the organization with and without AI. Tie the agenda to strategy and values. Kill use cases that do not fit.
Management Support (yours: 3.0)	"They are not serious."	Visible personal use from the top. One consistent message from the top team. Dedicated time, budget, and talent. Remove one famous barrier publicly.
Change Efficacy (yours: 4.0)	"We can't do this."	Fund skill building. Phase the rollout. Resource champions. Measure whether it is working.
Personal Valence (yours: 4.4)	"This is not worth it for me."	Answer "what's in it for me" by audience. Change recognition. Remove old friction. Be honest about role change.
