AI-Workforce Enablement and Readiness Assessment

Senior Leader Individual Feedback Report

FULL ASSESSMENT

Participant: Jack Sample

Role: SVP, Global Operations

Date: Sample Report

Report Type: Senior Leader Self-Assessment
(Full Individual Assessment) + AI Fluency Knowledge Check

1 Introduction

This report is the Senior Leader version of the AI-Workforce Enablement and Readiness Assessment. It measures how you set AI direction, shape the system around you, and stay personally ready — it is not the People Leader coaching and team-execution assessment.

This is the complete, full-length assessment: 86 items across five scored modules (86 items total), an unscored narrative section in your own words, and a 25-question AI Fluency Knowledge Check. Every parameter is measured directly — there is no sampling and no “not measured” caveat anywhere in this report, unlike the shorter Executive Lite tier.

The five modules measure 16 named parameters in total: 7 AI Leadership competencies, Change Agility, the four Holt readiness beliefs that make up Change Readiness, Organizational Enablers, and 3 Psychological & Motivational Readiness competencies. The AI Fluency check is scored and reported separately, alongside these five modules, and is not folded into your Overall Readiness figure.

2 About This Assessment

Senior leaders succeed when they articulate an AI-enabled future, model productive personal use of AI, translate vision into priorities while balancing speed and governance, drive organizational transformation as a sustained priority, embed AI in core processes and services, stay ahead of industry disruption, and build champions and their networks so adoption travels beyond hierarchy.

A 1–5 agreement/effectiveness scale is used throughout Modules A–E because this is a development instrument, not a selection test — the goal is to see how much a behavior or belief is present, not to sort people into pass/fail categories.

The AI Fluency Knowledge Check exists so a high self-rating is never accepted at face value when demonstrated knowledge of core AI concepts is low. It is graded objectively against a fixed answer key — there is no self-rating involved in this section at all.

3 How to Read This Report

Scores run from 1 (strongly disagree / almost never) to 5 (strongly agree / almost always). There is no universally “good” or “bad” score — the most useful reading compares modules and parameters against each other within this report, since that contrast is where real, actionable patterns show up.

Module scores are averages: each module's named parameters are scored first, then averaged into the module figure shown in the Executive Snapshot. Overall Self-Rated Readiness is the average of the five module scores (Modules A–E only) — your unscored “In Your Own Words” responses and your Fluency score are both reported separately and are never folded into that average.

Every finding in the Executive Snapshot, Overall Readiness Profile, and Priority Development Themes sections is drawn from your raw scores using AIISV's pattern-based methodology — the same consistent approach applied across every AIISV report — rather than written by hand for this report specifically.

4 Executive Snapshot

Figure 1. Executive Snapshot — Module Scores

Module	Score	Coverage
AI Leadership Competencies	 3.96	35 of 35 items measured
Change Agility	 4.17	6 of 6 items measured
Change Readiness	 3.15	20 of 20 items measured
Organizational Enablers	 3.2	10 of 10 items measured
Psychological & Motivational Readiness	 4.0	15 of 15 items measured
Overall Self-Rated Readiness	 3.7	Average of Modules A–E only

At a glance: Highest-scoring module: Change Agility (4.17). Lowest-scoring module: Change Readiness (3.15). Spread: 1.02 points.

What Jumps Out

Five module scores cluster tightly between 3.15 and 4.17, while the separately-scored AI Fluency check lands lower, at 64% — the gap between the two is this report's headline pattern, explored in full in Section 6's Overall Readiness Profile.

Change Agility (4.17) and Psychological & Motivational Readiness (4.0) are the clearest strengths on this profile; Change Readiness (3.15) is the one module pulling the average down, and it traces to a single belief rather than the whole module — see Module C's detail in Section 7.

Your own comments in Section 5 — delegating hands-on tool use to your team, and describing scattered, team-by-team AI adoption across the organization — line up directly with the scores above; the Congruency Check following Section 6 walks through exactly how.

5

In Your Own Words

These responses are unscored and are not part of your Overall Readiness figure. They exist to explain the scores above in your own words — shown here exactly as submitted.

What are the biggest AI challenges you face in your role right now?

“Getting the organization to move past pilots and into real operating-model change — we have a lot of AI activity but not yet the scale of impact I think is possible.”

What are your top 3 AI-related priorities for the next 90 days?

1. Stand up a clearer AI governance and sponsorship model at the executive level. 2. Push three priority use cases from pilot into production. 3. Invest in my own fluency with the specific tools my team uses day to day.

Which AI tools, platforms, or infrastructure do you personally use today?

“I rely on my team to run point on the actual tools — I review outputs and set direction more than I build hands-on myself.”

Which of those does the organization actually have access to and use?

“Scattered. Several teams have adopted tools independently with real results, but there is no single enterprise view of what is working or where.”

What would most help you make progress in the next 90 days?

“A sharper way to talk about AI fluency at the executive level, and a clearer model for what 'enough' sponsorship actually looks like in practice.”

6

Overall Readiness Profile

Figure 2. Overall Readiness Profile — Module Averages

WHAT THIS PATTERN SUGGESTS

Self-rated AI leadership readiness is strong and fairly even across modules (3.15 to 4.17) — but the AI Fluency check, an objective measure rather than a self-rating, lands meaningfully lower at 64%. That gap is the headline signal in this report, not any one module score.

This finding was identified directly from your raw module averages and 16 named-parameter scores using AIISV's pattern-based methodology — it is not a subjective read of your results. Your data was checked against every named pattern in the current library; this was the one pattern that met its criteria.

A Note on This Analysis

What a Self-Assessment cannot do on its own, however complete, is confirm whether colleagues, direct reports, or peers see the same pattern — it reflects one vantage point, even a fully measured one. Treat the pattern above as a well-measured, credible signal from your own perspective, not yet a cross-checked organizational diagnosis.

Congruency Check: Scores vs. Your Own Words

Where your open-ended comments (Section 5) line up with your scores, that agreement strengthens confidence in the finding. Where they seem to pull in different directions, that gap is not a scoring error — it is itself worth a second look.

1

Worth reflecting on — Self-Rated Readiness vs. AI Fluency: Three of five modules (A, B, E) average above 3.9, and your written comments describe AI as central to how you want the organization to operate — yet the Fluency check, which measures demonstrated knowledge rather than self-perception, came back at 64% (16 of 25). This is not a contradiction so much as a signal worth naming directly: strong vision and intent do

not, on their own, confirm hands-on technical grounding. It is worth asking whether that gap matters for how you personally engage with AI tools, or whether it is appropriately delegated to others on your team.

2

Aligned — Personal AI Use: Your comment that you “rely on my team to run point on the actual tools” directly matches the data — AI-Enabled Personal Productivity is your lowest-scoring item in Module A (2.6), well below the rest of that module. The qualitative and quantitative pictures agree: this is a deliberate delegation pattern, not an inconsistency in the scoring.

3

Worth reflecting on — Management Support vs. Being the Senior Leader: Management Support is your lowest Holt belief (2.2) — notable because, as an SVP, you are part of the “top team” this item asks about. Worth reflecting on whether this reflects doubt about peers above or beside you specifically, or a more general read that executive sponsorship across the organization is thinner than the vision for AI itself.

Questions worth sitting with, rather than answering immediately:

- Is delegating hands-on AI tool use to your team a deliberate, considered choice given your role — or is it also limiting your own fluency with tools you are asking others to adopt?
- What would it take to close the 64% Fluency score, and does closing it change how you lead AI conversations with your team or your board?
- When you rated Management Support low, were you thinking about your peers specifically, or the broader executive layer — and does that distinction change what you'd do next?

Going Deeper

A more reliable picture of whether this pattern holds beyond your own vantage point comes from adding other perspectives to this same instrument. AIISV offers ways to build that fuller picture and turn it into action:

- A 360 Assessment for this same role, gathering Manager, Direct Report, Peer, and Stakeholder views alongside your own Self-Assessment, to see whether colleagues read your AI fluency and sponsorship the same way you do
- Organization-wide rollouts of this same Individual Assessment across other senior leaders, to see whether the readiness-vs-Fluency gap is personal to you or a broader pattern across the leadership team
- Facilitated sessions that bring these findings into a live strategic conversation with the people who can act on them
- Customized training or coaching targeted specifically at closing the Fluency gap identified here

7 Module Detail

Module A — AI Leadership Competencies

The specific senior leadership behaviors required to drive successful AI transformation, across 7 competencies, all measured directly (35 items).

Why this framework: These competencies are derived from AI L4IR: Leadership and the Fourth Industrial Revolution, which observes leadership behaviors from leaders in academics and industry across the AI age. Research on digital and AI transformation consistently shows organizations that invest in leadership and change capability, not just technology, outperform those that don't — which is why this module measures leadership behavior directly rather than assuming it.

Figure 3. AI Leadership Competencies — Item Scores

Data Analysis: AI-Visionary Leadership (4.8) and Industry Disruption & Competitive Advantage (4.6) are this module's clear strengths — you describe AI's strategic stakes in concrete, specific terms. AI-Enabled Personal Productivity (2.6) is the outlier, well below the rest of the module, and AI Champions and Their Networks (3.1) is also comparatively modest. The pattern suggests a leader who sets direction clearly but has not yet built the personal-use habits or the champion network that typically carry a vision into daily practice.

Definitions

- **AI-Visionary Leadership:** Ability to articulate how AI creates strategic advantage and inspire others with a clear AI-enabled future.

- **AI-Enabled Personal Productivity:** Regular personal use of AI tools to produce real work and model productive adoption.
- **AI Scaled Agile Leadership:** Translating AI vision into executable priorities while balancing speed and governance.
- **AI Organizational Transformation:** Driving a clear current-state view, roadmap, and sustained organizational priority for AI.
- **AI-First Business Processes, Products & Services:** Embedding AI into core work rather than treating it as an add-on.
- **Industry Disruption & Competitive Advantage:** Staying ahead of AI-driven industry shifts and building distinctive advantage.
- **AI Champions and Their Networks:** Building and supporting networks of champions who spread adoption beyond formal hierarchy.

Module B — Change Agility

Personal capacity to adapt, learn, and remain effective during AI-driven change. A single flat scale, all 6 items measured directly.

Figure 4. Change Agility — Item Scores

Data Analysis: This is your highest-scoring module overall (average 4.17). Five of six items scored 4 or 5; the softest point, 'Learns new AI skills under time pressure' (3), is still comfortably above the midpoint. Change Agility is a genuine, consistent strength across this profile.

Definitions

- **Change Agility:** Personal capacity to adapt, learn, and remain effective during AI-driven change.

Module C — Change Readiness (Enterprise Level)

Holt et al.'s four readiness beliefs, applied at the enterprise level: is this the right change, are leaders committed, can the organization do this, and will people benefit. All 4 dimensions measured directly (20 items).

Why this framework: This module uses Holt, Armenakis, Feild, and Harris's Readiness for Organizational Change framework because readiness is fundamentally a set of beliefs, not a fixed personality trait — and any one of the four beliefs below can stall adoption on its own, even when the tools and the vision are otherwise good. That is why all four are measured directly rather than assumed from the other modules.

Figure 5. Change Readiness — Item Scores

Data Analysis: This is your lowest-scoring module. Management Support (2.2) is the weakest of the four Holt beliefs — a notable finding given your own seniority, since this item asks about the top team's visible backing, which includes your peer executives. Appropriateness (4.0) is comparatively strong, meaning the gap here is less about whether AI adoption is the right priority and more about whether the organization is backing it the way the strategy requires. Change Efficacy (3.0) and Personal Valence (3.4) sit in between.

Definitions

- **Appropriateness:** Belief that accelerating AI adoption is the right strategic priority for the organization now.
- **Management Support:** Belief that senior leaders are actually committed — not merely interested.
- **Change Efficacy:** Belief that the organization has, or can build, the ability to implement AI at the intended scale.
- **Personal Valence:** Belief that the change brings personal or organizational benefit.

Module D — Organizational Enablers

The supporting conditions the top team must create if AI transformation is to succeed. A single flat scale, all 10 items measured directly.

Figure 6. Organizational Enablers — Item Scores

Data Analysis: A moderate, mixed module (average 3.2) rather than a uniform strength or weakness — some conditions (resource allocation, policy clarity) read reasonably well, while others (systematic sharing of what works, protected learning time) lag. Unlike a module where every item points the same direction, this one suggests a short, specific punch list rather than one broad structural fix.

Definitions

- **Organizational Enablers:** The supporting conditions the top team must create if AI transformation is to succeed.

Module E — Psychological & Motivational Readiness

Internal mindset and motivational factors that influence engagement with AI, across 3 competencies, all measured directly (15 items).

Why this framework: These items sit conceptually alongside Big Five personality-trait research — particularly Openness and Emotional Stability, both linked in the literature to tolerance for ambiguity and organizational change. This module measures your current attitudes and behaviors, not a validated personality inventory, so treat it as a snapshot of where you are now rather than a fixed trait profile.

Figure 7. Psychological & Motivational Readiness — Item Scores

Data Analysis: A consistent strength (average 4.0) across all three competencies, with Learning Orientation (4.2) as the high point. Nothing in this module points to a gap — psychological and motivational readiness is not where this profile's real work is.

Definitions

- **Learning Orientation:** Seeking out new ways of working with AI rather than waiting to be trained.
- **Response to Ambiguity & Pressure:** Staying constructive and effective when AI outputs or requirements are imperfect or changing.
- **AI-Related Drivers & Values:** Underlying beliefs about whether AI primarily creates opportunity or threat.

AI Fluency Knowledge Check

Overall Fluency Score: 16 of 25 correct (64%)

General + Technical/AI-SDLC questions combined, Form C. 80–89% maps to a Fluency score of 4 on the assessment's 1–5 scale.

Full question-by-question detail is in Appendix A.

Calibration note: Demonstrated Fluency (64%) is the lowest-reading figure in this report — below every self-rated module average, including Modules A (3.96), B (4.17), and E (4.0). This is the inverse of a typical overconfidence pattern: self-rated readiness and intent are genuinely strong, but the objective knowledge check has not yet caught up. The gap is specific and addressable, not a sign that the self-ratings elsewhere in this report are unreliable.

9 Suggested Next Steps

- 1 **Name the Fluency gap directly**, rather than letting a strong self-rated readiness score stand in for demonstrated knowledge — 64% is a specific, addressable number, not a vague impression.
- 2 **Revisit Management Support with fellow executives** specifically, since this is the one Holt belief where seniority gives you unusually direct visibility and influence over the answer.
- 3 **Add a 360 Assessment** to see whether direct reports and peers read your personal AI fluency and the organization's sponsorship the same way you do.

10 Priority Development Themes

- 1 **The readiness-vs-Fluency gap is the headline finding**: Self-rated readiness is strong and fairly even across modules, but the objective Fluency check landed meaningfully lower at 64%. This is the pattern most worth acting on, more than any single module score.
- 2 **Management Support, not Appropriateness, is the real Change Readiness constraint**: Belief that AI is the right priority is comparatively strong (4.0); belief that the top team is visibly backing it is not (2.2). That distinction should shape where energy goes next.
- 3 **Change Agility and Psychological Readiness are not the issue**: Both modules average above 4.0. Whatever the Fluency and sponsorship gaps above require, it is not a lack of personal adaptability or motivation.

Action Planning

Reflecting on the results above, write down your top 5 actions to take next.

- 2.
- 3.
- 4.
- 5.

Appendix A — AI Fluency Knowledge Check Detail

(Form C — Questions, Your Answer, Correct Answer, and Result)

Question	Your Answer	Correct Answer	Result
What does SDD stand for in this assessment's engineering context?	Specification-Driven Development	Specification-Driven Development	Correct
What does ASI stand for?	Adaptive System Interface	Artificial Superintelligence	Incorrect
AutoML refers to:	Techniques that automate model selection, tuning, and feature engineering	Techniques that automate model selection, tuning, and feature engineering	Correct
What does XAI stand for?	Extended AI Infrastructure	Explainable AI	Incorrect
ADAM (in deep learning) is:	A hardware accelerator standard	An optimization algorithm that adapts learning rates for each parameter	Incorrect
Multimodal AI can:	Handle more than one kind of input, such as text, image, and audio	Handle more than one kind of input, such as text, image, and audio	Correct
Overfitting occurs when a model:	Fits training examples so tightly that it generalizes poorly	Fits training examples so tightly that it generalizes poorly	Correct
Human-on-the-loop differs from human-in-the-loop because the person:	Approves every step before it runs	Supervises and can intervene, but does not approve every step	Incorrect
Synthetic data is:	Data generated by a system rather than collected from real events	Data generated by a system rather than collected from real events	Correct
Model risk includes:	Harm from errors, bias, privacy leakage, misuse, or over-reliance	Harm from errors, bias, privacy leakage, misuse, or over-reliance	Correct
What does LLM stand for?	Large Language Model	Large Language Model	Correct
An AI agent is best described as:	A chatbot with a longer memory window	A system that can plan, use tools, and take actions	Incorrect
Vibe coding refers to:	Building software primarily via natural-language prompts with AI	Building software primarily via natural-language prompts with AI	Correct
Prompt engineering is:	Replacing all programmers with chat windows	Designing inputs and instructions that improve model performance	Incorrect
Responsible AI emphasizes:	Safety, fairness, privacy, accountability, and human oversight	Safety, fairness, privacy, accountability, and human oversight	Correct

Question	Your Answer	Correct Answer	Result
In MCP, Prompts are:	A logging format for model outputs	Pre-written reusable templates that guide model behavior	Incorrect
An AI agentic workspace (IDE) is designed to:	Manage multi-file edits, spec-driven work, and broader codebase tasks	Manage multi-file edits, spec-driven work, and broader codebase tasks	Correct
An AI test / spec evaluator typically:	Designs and writes tests from code or specification changes	Designs and writes tests from code or specification changes	Correct
A framework is:	A reusable, semi-complete structure that developers extend or override	A reusable, semi-complete structure that developers extend or override	Correct
A library is:	A collection of reusable code called to perform isolated tasks	A collection of reusable code called to perform isolated tasks	Correct
Middleware typically intercepts requests to:	Compress files before sending them to storage	Enforce security, logging, and validation	Incorrect
Endpoint definitions expose:	Structured system paths via HTTP verbs or similar interfaces	Structured system paths via HTTP verbs or similar interfaces	Correct
Client SDKs are used to:	Simplify connections to external platforms through packaged methods	Simplify connections to external platforms through packaged methods	Correct
Design patterns are:	Repeatable solutions to common design problems	Repeatable solutions to common design problems	Correct
Eval / evaluation harnesses in agentic work are used to:	Measure whether outputs meet spec or quality bars	Measure whether outputs meet spec or quality bars	Correct

Overall Fluency: 16 / 25 correct = 64%

Appendix B — Item-Level Data

Every named parameter score, computed as the average of its underlying items — nothing rounded until display.

Module	Parameter	Score (of 5)
A	AI-Visionary Leadership	4.8
A	AI-Enabled Personal Productivity	2.6
A	AI Scaled Agile Leadership	4
A	AI Organizational Transformation	4.2
A	AI-First Business Processes, Products & Services	4.4
A	Industry Disruption & Competitive Advantage	4.6
A	AI Champions and Their Networks	3.1
B	Change Agility (avg. of 6 items)	4.1667
C	Appropriateness	4
C	Management Support	2.2
C	Change Efficacy	3
C	Personal Valence	3.4
D	Organizational Enablers (avg. of 10 items)	3.2
E	Learning Orientation	4.2
E	Response to Ambiguity & Pressure	3.8
E	AI-Related Drivers & Values	4

Appendix C — Respondent & Submission Details

Field	Value
Access Code	SLS-SAMPLE-01
Respondent Email	jack.sample@example.com
Product Line	Senior Leader
Job Title	SVP, Global Operations
Fluency Form	C
Overall Self-Rated Readiness (avg. of Modules A-E)	3.7

Appendix D — Holt Change Readiness Development Actions

From the Sr Leader Handbook's Holt Development Actions table — the recommended first actions for a senior leader when a given Change Readiness belief is low. For your profile, Management Support is below that threshold; the full table is included below for reference alongside all four of your Module C scores.

If low	Typical belief	First actions
Appropriateness (yours: 4.0)	"Wrong change, wrong time."	Publish the data. Contrast the organization with and without AI. Tie the agenda to strategy and values. Kill use cases that do not fit.
Management Support (yours: 2.2)	"They are not serious."	Visible personal use from the top. One consistent message from the top team. Dedicated time, budget, and talent. Remove one famous barrier publicly.
Change Efficacy (yours: 3.0)	"We can't do this."	Fund skill building. Phase the rollout. Resource champions. Measure whether it is working.
Personal Valence (yours: 3.4)	"This is not worth it for me."	Answer "what's in it for me" by audience. Change recognition. Remove old friction. Be honest about role change.
